

SORHAL POLYMETALLIC MINE

Behsazan farnood hafar

Location: Kurdistan Province - Dehgolan

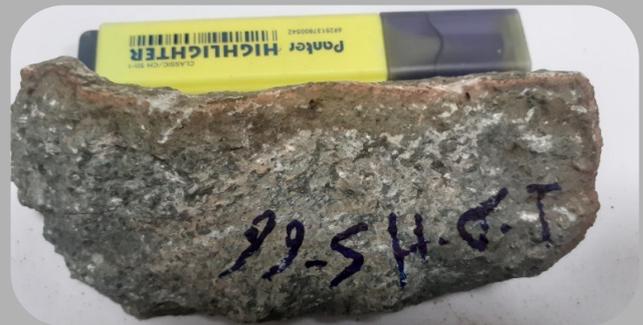

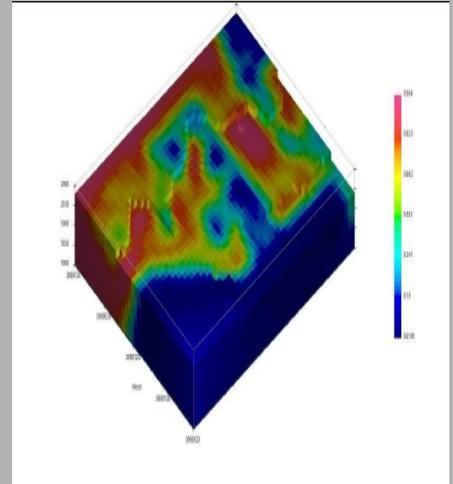

Area: 83 ha

Anomaly: Polymetallic

Geophysics: Magnetometry 700 points

Study: Geochemistry and Remote Sensing

Exploration License Phase 3 and 4

The Sorhal polymetallic exploration area is located on the 1:100,000 Sanandaj geological map. The entire area, situated within the Sanandaj-Sirjan geological zone, consists of a single geological unit. This area holds exploration licenses for stages 3 and 4. After remote sensing studies and processing of ASTER satellite data, it was determined that the area is prospective for iron ore deposits. For this reason, magnetometry geophysical studies have been conducted at 700 designated points, and the area is ready for semi-deep exploratory drilling.
